# Agenda

→ Deadlocks

→ Schema Design

- process / how to approach SP
- 2 Case study (Scaler, Netflix)

## Deadlocks

Take Locks in a Fixed order

T1 → 12, 13 finishes

T2 → 12, 13 finishes (take locks in asc order on resources)

- Deadlocks can't be avoided always.

↳ Roll back one of transactions when deadlock is detected.

## Schema Design - Designing the structure of DB.

- Tables
- columns
  - PK,
  - FK
- Indexes, Views etc.
- Relationship b/w Tables.

ER Diagram

## 4 Step Process

## Case Study: Scaler

The requirements are as follows:

Scaler will have multiple batches.

For each batch, we need to store the name, start month and current instructor.

Each batch of Scaler will have multiple students.

Each batch has multiple classes.

For each class, store the name, date and time, instructor of the class.

For every student, we store their name, graduation year, University name, email, phone number.

Every student has a buddy, who is also a student.

A student may move from one batch to another.

For each batch a student moves to, the date of starting is stored.

Every student has a mentor.

For every mentor, we store their name and current company name.

Store information about all mentor sessions (time, duration, student, mentor, student rating, mentor rating).

For every batch, store if it is an Academy-batch or a DSML-batch.

Cardinality: Relation: students enroll to batch.

TRICKS: Think for 1 student = 1 batch  
Think for 1 batch = M students

M:M

M: M

1: M

In an educational institution, a student opts for a major subject. This subject might be the choice of several students, but a student cannot major in more than one subject. How would you describe the cardinality between **Student** and **Major** ?

25 users have participated

A	One-to-One	16%
B	One-to-Many	32%
C	Many-to-One	48%
D	Many-to-Many	4%
